Speedwell Weather System

SWS

The Open Weather Derivative Pricing and Risk Management System

Version 6.6: What's new?

SWS Version 6.6 was released in August 2009.

This document previews its new features and enhancements

SWS 6.6 New Features include:

> ## New end of month PL report

A new module allows the user to create an end of month report which automatically calculates the changes in the Profit and Loss compared with the previous month.

> ## Individual transaction calculations saved in the database

The transaction values are now saved in the database for an easy retrieval as well as in the usual portfolio report.

> ## Improved Portfolio Permission Settings

It is now possible to restrict which portfolios can be seen by users who have access to the various portfolio features. This allows a partner to log into SWS and only see their authorised or shared portfolios whilst still using the same unique global database.

> ## Other Recent Enhancements

- New data types and data hierarchies (Synop cleaned, Climate Cleaned, Speedwell Recalibrated, etc)
- Support for using both the Speedwell Weather Recalibrated Data Sets and MDA EarthSat Enhanced data.
- New screen to price a deal using 5 different models simultaneously

> ## SWS Hosted Option

SWS can now be licenced as a hosted application as well as an internally-installed application. This gives the full flexibility of SWS without the set up and maintenance costs. The flexible permissioning which allows different users different access rights is preserved. Please contact us for more information.

> ## SWS Data: the new SuperPack

We are pleased to announce that a new weather data subscription option is available. The SuperPack opens our archive of standard daily and hourly data sets covering 1000's of world-wide sites. The SuperPack available at a discounted rate to SWS Enterprise licence subscribers.
